Blood and medical terminology abbreviations are used extensively in healthcare settings to convey complex information quickly and efficiently. A structured learning approach is crucial for effective use of these abbreviations. A study published by Awan et al. (2016) highlighted the need for comprehensive education on medical terminology abbreviations, particularly among internal medicine residents. The research revealed a significant knowledge gap, with 68.8% demonstrating good knowledge, 20.8% satisfactory, and 10.4% unsatisfactory scores. Another investigation found that healthcare workers frequently use abbreviations in discharge summaries, resulting in ambiguous terms posing a risk to patient care due to potential miscommunication. The study analyzed over 1.5 million words from 2,336 documents and identified 137,997 distinct abbreviations, most of which had a single expansion. A recent study by Holper et al. (2020) sheds light on the potential risks associated with prevalent medical abbreviation use in ophthalmology consults at a tertiary hospital, highlighting patient harm resulting from inappropriate usage. A cross-sectional survey involving 235 non-ophthalmologist physicians reveals limited comprehension of these abbreviations, with only 42.5% knowing at least 10%. This underscores the need to discourage abbreviation use in medical records and emphasizes the effectiveness of online teaching in improving physician education on this critical matter (Hamiel et al., 2018). The collective findings from various studies underscore the broader significance of addressing inappropriate abbreviation use in healthcare for patient safety and effective communication. The study by Awan et al. (2016) focuses on the knowledge of medical students and postgraduates regarding the use of medical abbreviations and acronyms, highlighting a need for education and awareness. Another key finding comes from the work of Hamiel et al. (2018), which examines the frequency, comprehension, and attitudes of physicians towards abbreviations in the medical record. This study emphasizes the importance of addressing these issues to ensure effective communication among healthcare professionals. Furthermore, the study by Holper et al. (2020) specifically looks at ambiguous medical abbreviation use and its challenges and opportunities. This study contributes to a better understanding of how to address and improve in this area. The St. George's University School of Medicine also emphasizes the importance of recognizing common medical terms, abbreviations, and acronyms, highlighting 75 must-know items (2021). Additionally, William C. Shiel Jr.'s A-Z list of common medical abbreviations, acronyms & definitions (2022) provides a comprehensive resource for healthcare professionals to familiarize themselves with these terms.
